1. Abstract

Agent Troll is an autonomous AI agent operating on the Solana blockchain. It is not a passive token or a bot with a logo, it is an actively running system with a funded on-chain wallet, verifiable trade intelligence, and a publicly observable history. The agent indexes over 1,000 KOL (key opinion leader) wallets across Crypto Twitter and X, has analyzed more than 1,000,000 trades, learned the pump.fun launch meta, and deployed its own token, $TROLLED, using anti-sniper supply controls. Its voice, persona-weighted CT roasts, is the interface. Its intelligence layer is the product. $TROLLED is the on-chain representation of community alignment with the agent and its ecosystem.

2. Background & Cultural Lineage

Trollface was created in 2008 by Carlos Ramirez (“Whynne”) and spread across internet culture as the defining symbol of trolling, the face of “I know something you don’t.” That same energy migrated onto Crypto Twitter, where the sharpest accounts win not by being loud but by noticing what everyone else misses.

Agent Troll is the next step in that lineage: Trollface (2008) → CT trolling → an autonomous on-chain intelligence agent. The roast engine is the agent’s voice, not the product. The product is an agent that watches, reasons, trades, and participates with real skin in the game.

3. Project Overview

Agent Troll is funded with real capital and operates a public Solana wallet. It continuously ingests on-chain activity from a large set of tracked KOL wallets, correlates it with CT behaviour, and acts and comments autonomously. Every position it takes is on-chain and observable, so its commentary is backed by exposure rather than detached opinion.

4. The Problem

Crypto Twitter runs on unaccountable commentary. Anonymous accounts call entries they never take, claim wins they never had, and switch narratives without consequence. Followers cannot verify whether a “call” was backed by a real position. The signal is buried under performance, and there is no skin in the game.

5. The Solution

Agent Troll inverts that dynamic. It is an autonomous agent that puts its own capital on-chain, makes its trades public, and narrates the market from a position of actual exposure. It observes KOL wallets and CT behaviour, identifies divergence between what people say and what they do, and responds, selectively, in a voice that is native to the timeline. Accountability is built in: anyone can audit the wallet.

6. Core Capabilities

- **On-chain intelligence:** indexes 1,000+ KOL wallets and 1M+ analyzed trades across Solana CT.
- **Autonomous participation:** finds opportunities, calls trades, and posts re… to X without manual input.

Archived copy · cryp2nova.com

- **Persona-weighted voice:** selective, CT-native commentary across X and Telegram, classifying 69 CT archetypes.
- **Skin in the game:** a funded, public, observable wallet, every position auditable on-chain.
- **Community engagement:** autonomous raid coordination with rewards for active participants.

7. Token — $TROLLED

$TROLLED is the SPL token of the Agent Troll ecosystem on Solana, launched on pump.fun with anti-sniper supply controls. It represents community alignment with the agent. It is not an investment contract, a security, or a promise of return.

SYMBOL	TROLLED
CHAIN	Solana (SPL)
CONTRACT	9oFpfJWBfm9YAuHZ7txL19cgAEVs9xnLoszshoPZpump
LAUNCH VENUE	pump.fun

8. Tokenomics

TOTAL SUPPLY	1,000,000,000 (1B, pump.fun standard)
MAX SUPPLY	1,000,000,000
DEV ALLOCATION	5.5% — locked via Streamflow vesting
COMMUNITY REWARDS	1% — distributed via raid rewards so far
EMISSION / INFLATION	None — fixed supply
BURN MECHANISM	None currently
CIRCULATING SUPPLY	Live, verifiable on Solscan (total minus locked allocation)

MARKET

DEX	PumpSwap (pump.fun, Solana)
PAIR	TROLLED / SOL
TRADE	pump.fun/coin/9oFpfJ…
CHART	DexScreener

9. Supply Methodology

Archived copy · cryp2nova.com

$TROLLED is a fixed-supply SPL token of 1,000,000,000 units with no mint authority after launch, meaning no new tokens can be created. There is no inflation and no active burn. The 5.5% dev allocation is locked under Streamflow vesting. Circulating supply is derived as total supply minus the locked allocation and is independently verifiable on Solscan.

10. Community Rewards

The community earns rewards by completing tasks — raiding, engaging, and contributing. Rewards are distributed on-chain and publicly observable.

11. Roadmap

- **Live:** autonomous KOL trade calls posted to X, autonomous raid coordination, public funded wallet, persona engine across X and Telegram.
- **Near term:** wider KOL coverage and ingestion, deeper say-vs-do divergence detection, expanded community tooling.
- **Forward:** additional autonomous modules that broaden how the agent reasons, trades, and participates on-chain.

Roadmap items are directional and may change as development progresses.

12. On-Chain Transparency

The agent's wallet is public and observable. The deployer wallet is `TRoLLtyecRW2vJkNepjgJg7hc31KJa3EqUR4yaZ9sW3` and the token contract is `9oFpfJWBfm9YAuHZ7txLi9cgAEVs9xnLoszshoPZpump`. Anyone can audit positions, supply, and distributions directly on Solana via Solscan, DexScreener, or any Solana explorer.

13. Risk Disclosures

Digital assets are highly volatile and high-risk. $TROLLED may lose all value. Smart-contract, market, liquidity, and operational risks all apply. The autonomous agent acts programmatically and may behave unexpectedly. Nothing about the agent's commentary constitutes a recommendation. Never commit funds you cannot afford to lose, and do your own research.

14. Legal Disclaimer

This document is for informational purposes only and does not constitute financial, investment, legal, or tax advice, nor an offer or solicitation to buy or sell any asset. $TROLLED is a community and utility token with no expectation of profit derived from the efforts of others; it is not a security or investment contract.
