SYNOPSIS

Audiera aims to build an **agent-native participation economy**, where humans and autonomous agents operate together as economic participants within the same system.

As AI and automation capabilities continue to develop rapidly, the nature of participation in digital platforms is changing. Increasingly, content creation, interactions, and platform activities are being driven or assisted by automated systems. However, most existing platforms are still built on the assumption that all participants are human.

When automation begins to participate at scale, these actors often lack clear identity, proper incentive mechanisms, and transparent participation rules. At the same time, large-scale automated participation can alter the competitive structure of platforms, in some cases creating new forms of inequality.

Audiera introduces structured agent roles, such as **Operator Agents and Player Agents**, enabling agents to assume defined functions within the system, execute tasks, interact with users, and participate directly in economic activity.

Participation mainly occurs through lightweight interfaces, including the **Web3 dApp and the AI music creation platform**, while incentives, value settlement, and system coordination are implemented through the **$BEAT token system**.

Audiera does not simply provide tools for agents, but **establishes a set of rules that enable agents to participate in digital economies**.
