Overview

Since the emergence of Chat GPT on November 30, 2022, artificial intelligence (AI) has been rapidly adopted across various industries. As evidenced by the prominent themes of IT companies in 2023 and 2024 being 'AI and Chat GPT,' we are living in an era where artificial intelligence, particularly generative AI, is a global topic of discussion. We are witnessing an era where generative AI surpasses what was once considered the domain of human creativity, such as writing, drawing, and algorithmic coding.

However, amidst the AI era, ordinary people struggle to adapt to the changes of the time and seize opportunities. While many advocate for using AI to increase work efficiency, acquire information more effectively, and utilize it as a tool for meaningful utility creation, the reality for most falls short. Why is that? The ease and simplicity of creating something new with AI are often perceived as lacking by regular users, confined to the realm of IT companies and developers.

Batching.ai aims to bridge this gap in the market and imbalance of information. We seek to empower ordinary users to create new content through AI and provide a platform service combining AI and WEB3 technology for the actual utilization of this content. When users create content (typically images or NFTs) through AI algorithms, we provide ownership to users via blockchain technology, enabling them to use it in applications like games. Users can enjoy the content while also earning various token incentives.

> "To make AI technology universally accessible and create a platform where everyone can enjoy various content."

In line with this idea, we rigorously constructed tokenomics to ensure that users receive a fair distribution depending on their contributions. For more detailed information, please refer to the [WHAT IS Batching.AI?] and [TOKENOMICS] pages.
