Introduction

What is bemo?

bemo is a non-custodial liquid staking protocol built on The Open Network (TON) blockchain. It is the first liquid staking application on TON that allows you to stake native GRAM tokens and, in return, get bmGRAM tokens which you can use freely in DeFi.

The price of the bmGRAM token to GRAM increases with the staking rewards accrued after each validation round by **bemo** protocol.

Who is behind bemo?

The creation of **bemo** was led by a diverse, skilled team. We are traditional finance professionals, blockchain experts, and software developers. We share a common goal of building investment products that would add value to every user, whether new or native to blockchain.

CRYP2NOVA

bemo smart contracts were developed by the team standing behind the first retail project launched on the TON - Fanzee ↗, an innovative sports fan engagement platform. The tech team has seven years of experience building blockchain platforms and applications.
