Welcome to BitFi

BitFi Overview

BitFi is an on-chain asset management platform with over $480M in assets under management. We leverage a unique **CeDeFi** architecture to deliver institutional-grade native yields combined with DeFi returns, serving both institutions and individual investors.

Vision

BitFi aims to be the safest and most efficient CeDeFi yield platform, enabling every user to access stable, transparent, and diversified returns across markets.

Core Advantages

- **CeDeFi Hybrid Yield:**
  Seamlessly integrate centralized finance (CeFi) and decentralized finance (DeFi) strategies to deliver consistent, high-quality yields.

- **Institutional-Grade Infrastructure:**
  Built by a team with deep experience from both Wall Street and top DeFi protocols, BitFi bridges TradFi expertise with DeFi innovation.
- **Comprehensive Product Suite:**
  - **bfBTC:** Yield-bearing liquid staking token for BTC
  - **bfUSD:** Yield-bearing stablecoin backed by USDC/USDT
- **Proven Traction:**
  - $480M+ in assets under management
  - Over 20,000 retail users
  - Native APR 6+%
- **Robust Security:**
  Multi-layer risk management, audited smart contracts, and institutional-grade custody partners.
- **Strong Backing:**
  Supported by **Fundamental Labs**, **CGV Fund**, **Hemi Labs**, **Citizen Journalists Network**, **IBC**, and other leading investors.

bfBTC

bfBTC represents BitFi's native route for Bitcoin holders to unlock CeDeFi yields. The token is minted when BTC is bridged on-chain, then deployed into mirror trading, liquidity, and DeFi strategies coordinated by Ceffu's MirrorX engine. The resulting revenue—combined with protocol-level incentives—is distributed back to bfBTC holders, so the token's exchange ratio steadily grows while remaining redeemable 1:1 for native BTC across chains.

bfUSD

bfUSD is a fully collateralized USD stablecoin minted from USDT and USDC with Chainlink-secured pricing. Holders can stake bfUSD into the low-risk Horizon pool (hbfUSD) or the higher-yield Pulsar pool (pbfUSD), each operating as ERC-4626 vaults with target APYs (9% for hbfUSD, 17% for pbfUSD). Yield stems from the pooled staking revenue, cross-pool insurance buffers, and boosted distributions from the Horizon pool, while redemption paths (standard and instant) preserve capital stability.
