BitStable Technical Docs

Copy

The BitStable Protocol is the platform through which anyone, anywhere can generate the DAII stablecoin against bitcoin ecosystem collateral assets. Learn how it works.

BitStable is a pioneering decentralized asset protocol on the Bitcoin blockchain, offering a unique framework for the creation, trade, and management of synthetic assets. It enhances asset liquidity on the Bitcoin chain through a dual-token system and a cross-chain compatible structure. This documentation provides an in-depth overview of the BitStable protocol, its components, and functionalities.

DAII:

- **Stable and Secure**: DAII is a stablecoin that derives its value and stability from the robustness of Bitcoin ecosystem assets: BRC20, RSK and the lightning network.
- **Purpose**: Serves as a medium of stability in the volatile cryptocurrency market, making it a reliable asset for trade and investment.
- **Cross-Chain Utility**: With its cross-chain capabilities, DAII not only benefits Bitcoin users but also brings the Ethereum community into the fold, fostering a more interconnected and fluid blockchain ecosystem.

BSSB:

- **Governance and Involvement**: As the governance token of BitStable, BSSB empowers its holders with decision-making authority, ensuring that the protocol evolves in a direction shaped by its community.
