Bootstrap

Bootstrap routes PumpSwap creator fees back into the liquidity pool — automatically, on-chain, and verifiably. Creators configure their fee allocation, lock it before launch, and Bootstrap handles the rest.

No new tax on traders. No manual intervention. Just fees compounding into deeper pools.

Why it matters

Most tokens die — that's the nature of memecoins. Bootstrap doesn't change that. But when a token actually runs, liquidity is what determines whether it sustains or collapses. Bootstrap makes sure the pool grows with the token.
