the superintelligence protocol

cyber core nav entity cyber

π 1.22% 256 words · 2 min

The protocol for planetary superintelligence. manifesto

Superintelligence is the defining infrastructure of a Type I civilization — a planet where every agent, human or machine, sensor or organism, contributes knowledge to a single self-improving graph.

Archived copy · cryp2nova.com

The cybergraph is this graph, built for a mole of connections — the threshold where individual links become collective intelligence the way individual molecules become a life. No single model owns this intelligence. It emerges from the shape of all connections between all participants — every claim signed, every link staked, the whole structure proving its own correctness.

Every link costs real focus, a conserved quantity that flows through the graph the way energy flows through a physical system — it cannot be created or destroyed, only redistributed by collective attention. Lies cost real resources. Truth accumulates gravity. And so collective intelligence converges to what genuinely matters, without voting, without moderators, without any central authority.

The graph speaks neural, the first language native to both humans and machines. Here a concept is a position in the topology, defined by everything connected to it.

Alignment becomes a measurement rather than a hope. Human values and machine values live in the same graph — when they diverge, the divergence is visible, and the protocol rebuilds the model from what humans actually linked. For the first time, a civilization can see the shape of its own intelligence, correct its machines when they drift, and prove the correction worked.

The future of the Earth is yours to cyberlink. Open your cyb, read cyber/whitepaper, and join.
