Chef Universe

CHEF Universe is an onchain open economy world centered around 'cooking'. In this ecosystem, games serve as the core layer through which players experience and expand the economy. Ingredients exist as onchain tokens, where value is created and circulated through gameplay and various interactions.

In this universe, burgers, dishes, and recipes are assets rather than simple items. Players acquire ingredient tokens through gameplay to create dishes, and these dishes can be decomposed back into raw material tokens. This entire process is recorded and owned onchain.

Web3 & Hybrid Casual: The Key Connecting Gamers and Traders

In the Web2 market, Hybrid Casual games have created new sectors through low entry barriers and engagement. With approximately 80% of current Web3 users being non-gamers, providing an accessible game structure is the key element for connecting gamers and traders.

CHEF Universe is built on Base, utilizing Base app features such as Smart Wallet, token management, and modular app structures. While traditional Web2 game structures often limit Live-Ops, the modular interface on the Base app allows for asset exchange and account management to support a sustainable operational structure.

Rolling Burger: The Genesis Hybrid Game

Rolling Burger is the first game of the CHEF Universe, born from this strategic background. Players collect ingredients through a dice game to craft Burger NFTs. Each Burger NFT is a unique testament to the player's luck and strategic choices, serving as the exclusive gateway to Ingredient Tokens. In other words, by disassembling these NFTs, players acquire specific ingredients based on the burger's grade and its constituent materials.

Burger NFT & Ingredient Tokens

Burger NFTs are the primary assets in the CHEF Universe and serve as the source for Ingredient Tokens. By disassembling a Burger NFT, players earn between one and three types of Ingredient Tokens based on the burger's Grade. For example, an SS-Grade burger yields 3 types of tokens, while a D-Grade burger yields 1 type.

The ecosystem includes 129 ingredient tokens, categorized from S to D grades. The exchange ratio with $CHEF tokens varies depending on the grade of the ingredient.
