Introduction & FAQs

Copy

👋Welcome

Welcome to Crocodile Finance, the Premier DEX Yield Station set to optimize yields across DEXs on Avalanche.

Featuring a dual model system with $CROC being **an revenue-backed stablecoin pegged to $AVAX on the Avalanche network; functioning as a multi-DEX yield optimizer for Pharaoh Exchange & Blackhole.**

Think of Tomb Finance and Convex combined.

CRYP2NOVA

Please NOTE: While Bonds are available via the contract, We HIGHLY discourage them.

While this is subject to change the reason is to not accure bad debt for the protocol or have users trapped in assets.

Overview

Here’s an improved and more polished **“Overview” section** for your documentation — clearer, more professional, and aligned with Crocodile Finance’s positioning as a yield optimizer *built on* Avalanche’s DEX infrastructure, not against it:

Overview

Crocodile Finance is a next-generation yield optimization protocol built on the **Avalanche** network, designed to strengthen the utility of $AVAX while maintaining deep, sustainable liquidity.

At its core, the protocol operates through a **dual-token model** — **$CROC** and **$gCROC** — adapted from refined revenue-backed systems. This model enables Crocodile to dynamically manage expansion and contraction while ensuring that $CROC remains **backed by $AVAX** through the **Peg Stability Module (PSM)**.

Unlike traditional liquidity farming protocols that fragment liquidity across multiple DEXs, Crocodile Finance **builds on top of existing DEX infrastructure** such as **Pharaoh** and **Blackhole**, optimizing yields and directing capital efficiently within the Avalanche ecosystem. This approach amplifies rewards for participants while maintaining liquidity depth and stability.

Through **strategic emissions**, **protocol-owned liquidity mechanisms**, and **PSM-backed accumulation**, Crocodile continuously grows its $AVAX reserves — reinforcing backing, yield consistency, and long-term sustainability.

In essence, **Crocodile Finance** bridges dynamic algorithmic mechanics with real yield principles — creating a unified ecosystem where liquidity, stability, and optimization coexist to make it the **premier yield station on Avalanche** this is what we call a **Revenue-Backed Stablecoin.**

We are highly optimistic about **Pharaoh & Blackhole** and have designed $CROC to enhance its utility within the **Avalanche** ecosystem.
