ETHplode Whitepaper

What is ETHplode?

ETHplode is a store of value built on the Ethereum blockchain with deflationary characteristics. Whenever $ETHPLO is transferred, 0.5% of the amount is burned. This built in self destructive functionality increases the assets scarcity over time, and is hard coded directly into our monetary structure.

ETHplode is based on the design of the Bomb token – the original hyper deflationary, self-destructing currency.
