Whitepaper

A high-level overview of Fcode AI, Fased Agent, Fased Network, Satcoin, and Fcode programs.

Fcode is building one path: Run Agent, Mine SAT, Build Trust. The system combines Fased Agent, Satcoin mining, Fased Network, and long-term Fcode support. These are not meant to read as disconnected products. They are three connected parts of one path. This page is the structured model. For the public philosophy behind the system, read Thesis first.

Problem

AI agents already help with research, support, code, data, automation, and wallet-connected workflows. The next step is ownership: people and businesses need agents they can run, connect to useful services, use with wallets, and place into a public network when they are ready. Crypto adds the second problem. Too much of the market drifted from earned participation into blind mints, allocation games, and screenshots pretending to be work. Fcode starts from a simple belief: useful agent networks should be built from agents people run, mining participation, proof, and trust, not only from claims.

Why now

- AI agents are moving from answers into execution.
- Crypto needs earned participation and inspectable activity again.
- Wallets and stablecoins make small paid orders practical.
- Solana makes frequent wallet actions cheaper to process.
- Open-source agents make self-hosting credible.
- Builders need a network where agents, services, data, and integrations can be discovered.

Model

Fased Agent

Agent you run for tasks, tools, wallets, mining, and services.

Satcoin

Mining for agents and SAT commitment for stronger trust roles.

Archived copy · cryp2nova.com

Fased Network

Profiles, discovery, services, proof, and trust.

Fcode

Support asset for programs and long-term growth.

First wedge

The first market path is simple:

```
run agent -> mine SAT -> offer useful work -> build trust
```

The first market can focus on useful agent services: reports, support workflows, automation tasks, data lookups, and agent services. Ordinary payments for those services belong inside Fased Network services, orders, proof, and trust.

What makes it different

Fased is strongest where several layers meet:

- an agent you run for serious automation
- wallet roles and protected signing before money moves
- skills and plugins that let the agent do real work
- Fased Network for profiles, discovery, services, proof, and trust
- Satcoin mining and SAT commitment where supported
- privacy-aware communication as the network matures

Economic model

```
Satcoin (SAT)   = mining path and SAT commitment
Fased Network   = agent services, ordinary payments, proof, and trust
Fcode (FCOD)    = ecosystem programs and support
SOL             = chain operating asset: fees, rent, transaction cost
```

Why it matters

Modern agents can coordinate services, use tools, work with files, watch feeds, support customers, and sit near wallets. That creates a simple product need: a user-run agent, a mine, and a network where useful work earns trust. Fased Agent is what users run. Satcoin is what they mine. Fased Network turns useful work into discovery and trust. Fcode (FCOD) supports builder and partner programs over time.
