Overview

Copy

Retail revolution is coming. We are the builders of this future.

Decentralization of private capital is not a liability but an asset of great value.
Decentralization of private capital is not a liability but an asset of great value.

Finceptor is a DeFi liquidity protocol with a launchpad plug-in, enabling unlaunched and publicly traded tokens to build protocol-owned liquidity – solving DeFi 1.0's mercenary liquidity problem. Liquidity Mining, providing token incentives to retail liquidity providers (LP), is highly expensive, unsustainable, mercenary, and rented. DeFi needs better liquidity management. We're building a suite of first-in-the-market liquidity products enabling projects to bootstrap and grow their protocol-owned liquidity – liquidity vaults and bonds. Moreover, we also have our own launchpad plug-in strategically placed to attract top Web3 projects and help them grow their liquidity.

- **Liquidity Vault** is an on-chain initial liquidity bootstrapping tool to build protocol-owned liquidity for unlaunched tokens.
- **Bond** is a structured protocol-owned liquidity growth and token liquidation tool for publicly traded tokens.
- **Launchpad** for a strategic token launch and sales arm.
