Introduction

The Immunefi token (IMU) is the central value creation asset of the Immunefi security ecosystem.

IMU creates a self-reinforcing security flywheel: it incentivizes projects, security researchers, and even community members to strengthen onchain security so that everyone can participate and be rewarded.

IMU also fuels the contribution of high-quality threat data to train the Immunefi AI, which then will safeguard ever-larger amounts of onchain capital.

As the AI grows smarter and the value it protects expands (ultimately toward a decatrillion dollar future), IMU becomes a proxy for the scale, trust, and maturity of the entire onchain economy.
