Overview

JADE — A Solana-Native Digital Store of Value

JADE is a fully decentralized mining protocol built natively on Solana. Every single token must be mined — there is no pre-mine, no team allocation, and no airdrops. The protocol features a hard-capped supply of 21 million JADE with smoothly diminishing emissions, bringing sound money principles to the fastest L1 blockchain.

Miners deploy SOL to a 5x5 grid each round, competing for rewards in both SOL and JADE tokens. Rounds last approximately one minute. Winners on the selected square split the round's SOL pool and receive that round's JADE emission.

Beyond mining, the protocol offers staking yield from a built-in buyback & burn mechanism, a guild system for pooled rewards and reputation, automated deployments, and a referral program — all enforced on-chain with no centralized intermediary.

JADE's conviction system ties Mining Power to how much you stake back versus how much you claim, scaled by your level. Dedicated miners with high conviction can earn up to 2× weighted deployments.
