Cloud computing is broken.

Today's cloud is controlled by a handful of giants. Prices are opaque. Vendor lock-in is the norm. And millions of GPUs sit idle while developers overpay for compute.

Traditional Cloud

- Opaque pricing
- Vendor lock-in
- Centralized control

LinqProtocol

- Transparent pricing
- Open protocol
- Decentralized network

How It Works

From deployment to settlement in minutes

01

Choose Your Stack

Select from 50+ production-ready templates or deploy your own containers. If it runs on Kubernetes, it runs on LinqProtocol.

02

Configure & Deploy

Set environment variables, choose your resource tier, and launch. Smart contracts connect you with optimal providers.

03

Pay On-Chain

Fund with LNQ via WalletConnect. Funds held in escrow - providers only get paid when they deliver.

CRYP2NOVA

Archived copy · cryp2nova.com

04

Monitor & Scale

Access apps through secure endpoints. Real-time logs, metrics, and provider performance in your dashboard.

See How It Works →

Enterprise Kubernetes

Real multi-pod deployments with battle-tested orchestration. Not toy containers - production infrastructure.

```
> kubectl apply -f deploy.yaml
> deployment.apps/api created
Pods running: 3/3
```

On-Chain Escrow

Payments held in smart contracts. Providers only get paid when they deliver. Verify everything.

Crypto-Native Payments

Pay with LNQ via WalletConnect. No credit cards, no invoices, no accounts payable.

Networking That Works

Cloudflare tunnels, platform routes, custom domains, and Kubernetes service discovery without provider-side port forwarding.

Aura CodeFeatured

Build anything with AI-powered development

Aura Code gives you a complete cloud development environment with AI assistance built in. Spin up sandboxes, scaffold frameworks, and deploy - all from your browser.

Archived copy · cryp2nova.com

Full Docker Sandboxes

Not just code editors. Complete isolated environments with live terminals.

Framework Scaffolding

Start with Vite, React, Next.js, Express, Python, or go fullstack.

3 Domain Slots

Each sandbox gets API, frontend, and console domains automatically.

AI That Understands Context

Built on a customized OpenCode fork that's aware of its environment.

Pricing

Up to 82% savings vs. AWS

Same infrastructure. Fraction of the cost.

Feature	LinqProtocol	AWS
Container Orchestration	✓ Real Kubernetes	EKS (Managed)
Typical VM (4 vCPU, 16GB)	✓ ~$25/mo	~$120/mo
Egress Bandwidth	✓ Included	$0.09/GB
Payment Options	✓ LNQ, (Enterprise: Stables & Fiat)	Credit Card
Lock-in	✓ None - Open Protocol	Vendor Lock-in
Transparency	✓ On-chain	Opaque
