Welcome to marginfi

marginfi is a fully-decentralized borrowing and lending protocol built on Solana. With marginfi, you can access native yield, embedded risk systems, and off-chain data plug-ins all in one place. Use marginfi to access the margin you need, when you need it.

Features

End-to-End Risk Engine: Constantly monitors the health of each individual bank, covering the entire protocol's risk comprehensively.

In-House Liquidators: While marginfi has in-house liquidators, the protocol also encourages and includes a significant number of external liquidators to ensure a robust and efficient liquidation process.

Market Depth and Recovery Modeling: Gathers data to model market depth and recovery time, enabling predictions of future liquidity in various market scenarios.

Archived copy · cryp2nova.com

Dynamic Risk System: Plans to implement live bank updates directly from risk models for a dynamic and real-time risk management system.

Global Borrowing and Lending: The protocol enables borrowing and lending of margin under a unified global context, streamlining the process for traders.

Leverage Trading: marginfi supports trading with leverage, empowering traders to maximize their market participation.

Comprehensive Market Access: Traders can optimize their financial exposure across over 100 DeFi projects on Solana, including spot, futures, and options markets.
