welcome.

lode is a uniswap v4 hook that intercepts the first swap of every block on opted-in pools, charges that swap a premium scaled to the captured arbitrage, and routes the proceeds to liquidity providers, the pool's builder, and an open-market lode buyback.

what is lodethe one-paragraph explainer, plus a side-by-side with vanilla v4. how it workshook, auction, splitter, vault — in five minutes. protocol architecturecomponent diagram and contract responsibilities. tokenomics100m fixed supply, distribution, and the burn loop. mainnet addressesverified contract addresses with etherscan links.

quickstart

three minutes to your first interaction:

1. read what is lode for the one-paragraph explainer.
2. skim how it works for the mechanism.
3. open the dashboard to see live auctions and your positions.

where to go from here

if you're an **lp**, start at liquidity providers · overview. if you're a **builder**, start at builders · overview. if you're a **researcher**, jump to protocol architecture.
