👋/start

hello, trader,

Lootbot.ai is a platform that revolutionizes the way people transact and interact with blockchain protocols by turning social media platforms into blockchain platforms. Within Lootbot, social media accounts will get built-in decentralized wallet system and turn social media platforms into synthetic blockchains. Through simple text commands, users can perform on-chain activities such as bridging and purchasing tokens across networks, as well as sending funds to others, all without leaving their social media accounts.

User can broadcast their transactions on a social media platform rather than utilizing a wallet, and as long as an indexer is able to get attestations of the transaction, it can be pushed and take action for that user onchain. These transactions are ordered into a synthetic blockchain, and are committed to update the state of an established ledger. Therefore the synthetic blockchain is able to interact with its base layer.
