Rich Milli Coin (RMC)

Concise Whitepaper – 2025

Executive Summary

Rich Milli Coin (RMC) is a luxury-aligned digital currency built on the Solana blockchain, engineered for stability, premium presentation, and real-world commercial use. RMC is designed to function as a settlement-ready digital asset suitable for high-end online commerce, professional liquidity management, and future payment integrations.

Digital Payments & E-Commerce Vision

RMC's long-term objective is to operate as a premium payment option for online shoppers. By leveraging Solana's speed and low fees, RMC enables instant settlement, minimal transaction costs, and transparent on-chain receipts. Future merchant integrations will support loyalty incentives, improved checkout experiences, and reduced reliance on traditional payment processors.

Liquidity Architecture & Price Stability

RMC utilises a USDC-paired Concentrated Liquidity Market Maker (CLMM) structure on Raydium. This model provides controlled price ranges, reduced volatility, and predictable valuation, which are essential characteristics for a token intended for commerce and settlement. By avoiding SOL-paired markets, RMC removes external asset volatility and reinforces pricing stability.

Tokenomics

RMC has a fixed total supply with nine decimal precision. Liquidity is primarily paired with USDC and managed internally to maintain market depth and stability. Governance is initially centralised to ensure consistency and operational control, with a structured decentralisation roadmap planned.

Formal Migration Explanation

The original RMC deployment was subject to irreversible metadata and branding limitations imposed by the Pump.fun architecture. To protect brand integrity, enable commercial scalability, and ensure long-term immutability, a new token mint was formally deployed with permanently revoked update authority.

Roadmap Overview

Phase 1 focuses on brand consolidation and liquidity stability. Phase 2 introduces payment integration research, merchant tooling, and loyalty mechanics. Phase 3 expands partnerships and exchange outreach, while Phase 4 develops ecosystem features such as premium access and token-gated services.

Conclusion
