Sentivate Whitepaper

SENTIVATE – The Universal Web.
Sentivate is a hybrid web built to be a viable & realistic replacement for the modern web. The network is designed to go beyond the capabilities that any solely centralized or decentralized network could offer. Sentivate addresses the following issues directly: bandwidth crisis, outdated protocols, broken DNS, lack of accountability, lack of identity, reactive security, Domain rules, and web categorization.

FOCUS
This white paper is focused on the core network design that serves as the base network & components for Viat, hApps, and the Universal Web. An additional white paper will be released solely on Viat. All technology is focused on ensuring Sentivateis a revolutionary not an evolutionary replacement, in Internet architecture.
