Introduction

Copy

Share is the first impact fund owned by everyone.

Creating a community and narrative meant to redefine what it means to make impact through capital, Share is empowering individuals all over the world to partake in a socioeconomic system that allows them to join forces through capital, command change in unity, and earn from impact made.

Utilizing a self-funding model that leverages part of its token liquidity as investment capital, the Share foundation operates as the first decentralized impact fund.

With an investment strategy focused on financing revenue-generating physical infrastructures that provide basic human needs services, the Share community strategically owns the assets, revenue, and data generated by each investment. As a result, Share is creating a decentralized network of physical infrastructure, funneling revenues back into its ecosystem.

The Share Foundation’s capital deployment strategy is designed to maximize impact and returns.

Considering the traditional financial system's limited reach and historic neglect of certain areas of the world, today 4.2 billion people still lack access to at least one basic human need.

Leveraging its decentralized governance and the deployment velocity of cryptocurrencies, Share becomes a first mover in untapped markets that present an opportunity for massive impact and revenue.

Share's fund model solves issues in both traditional sectors and the Web3 space.

By providing the liquidity necessary to build physical infrastructures targeting unmet social needs, Share leverages the inherent transparency of blockchain technology, surpassing the accountability and narrative of traditional non-profits. This superior level of transparency, combined with profit incentives for scalability and growth, uniquely positions Share to attract capital from the ESG, CSR, and donation markets as a preferred recipient.

Within Web3, Share's model enters the space as a decentralized service provider scaling DePIN technologies. By virtue of owning its physical infrastructure network, Share has the ability to become a service provider for various DePIN projects, ultimately further increasing the yields of each investment. Additionally, Share's decentralized ownership allows DePIN technologies to scale while further increasing the safety and stability of their network as Share stands out from the monolithic infrastructure owners that most DePIN projects have to rely on.

With an approach to impact centered on data analysis, transparency, and a holistic view of economics, Share leverages cryptocurrencies as the gateway to a socioeconomic system primed for equitable and lucrative impact.

Through Share, social wealth grows with positive impact.
