FAQ

Frequently Asked Questions

How do I create a token? +

Connect your wallet, enter the name, symbol and supply, then add a logo and social links if you want. Token Creator mints it in a couple of minutes and you don't write any code. Standard SPL and Token-2022 options are both supported.

How do the fees work? +

Archived copy · cryp2nova.com

Each tool has a flat fee and you see the exact amount before you sign, with no hidden cuts. The fee is collected on-chain, on top of Solana's own network gas and, where needed, account rent (ATA).

Is it safe to connect my wallet, and do you hold my keys? +

Your keys stay with you. J Tools is non-custodial: it never asks for, sees or stores your private key. Every transaction is signed by your own wallet (Phantom, Solflare and others) in your browser, and we only prepare the transaction for you.

Can I swap from several wallets at once? +

Yes. Multi Swap lets you buy or sell from dozens of wallets in one run, and each wallet signs its own transaction. Direct DEX routes (the Pump.fun curve, PumpSwap and Raydium) are supported.

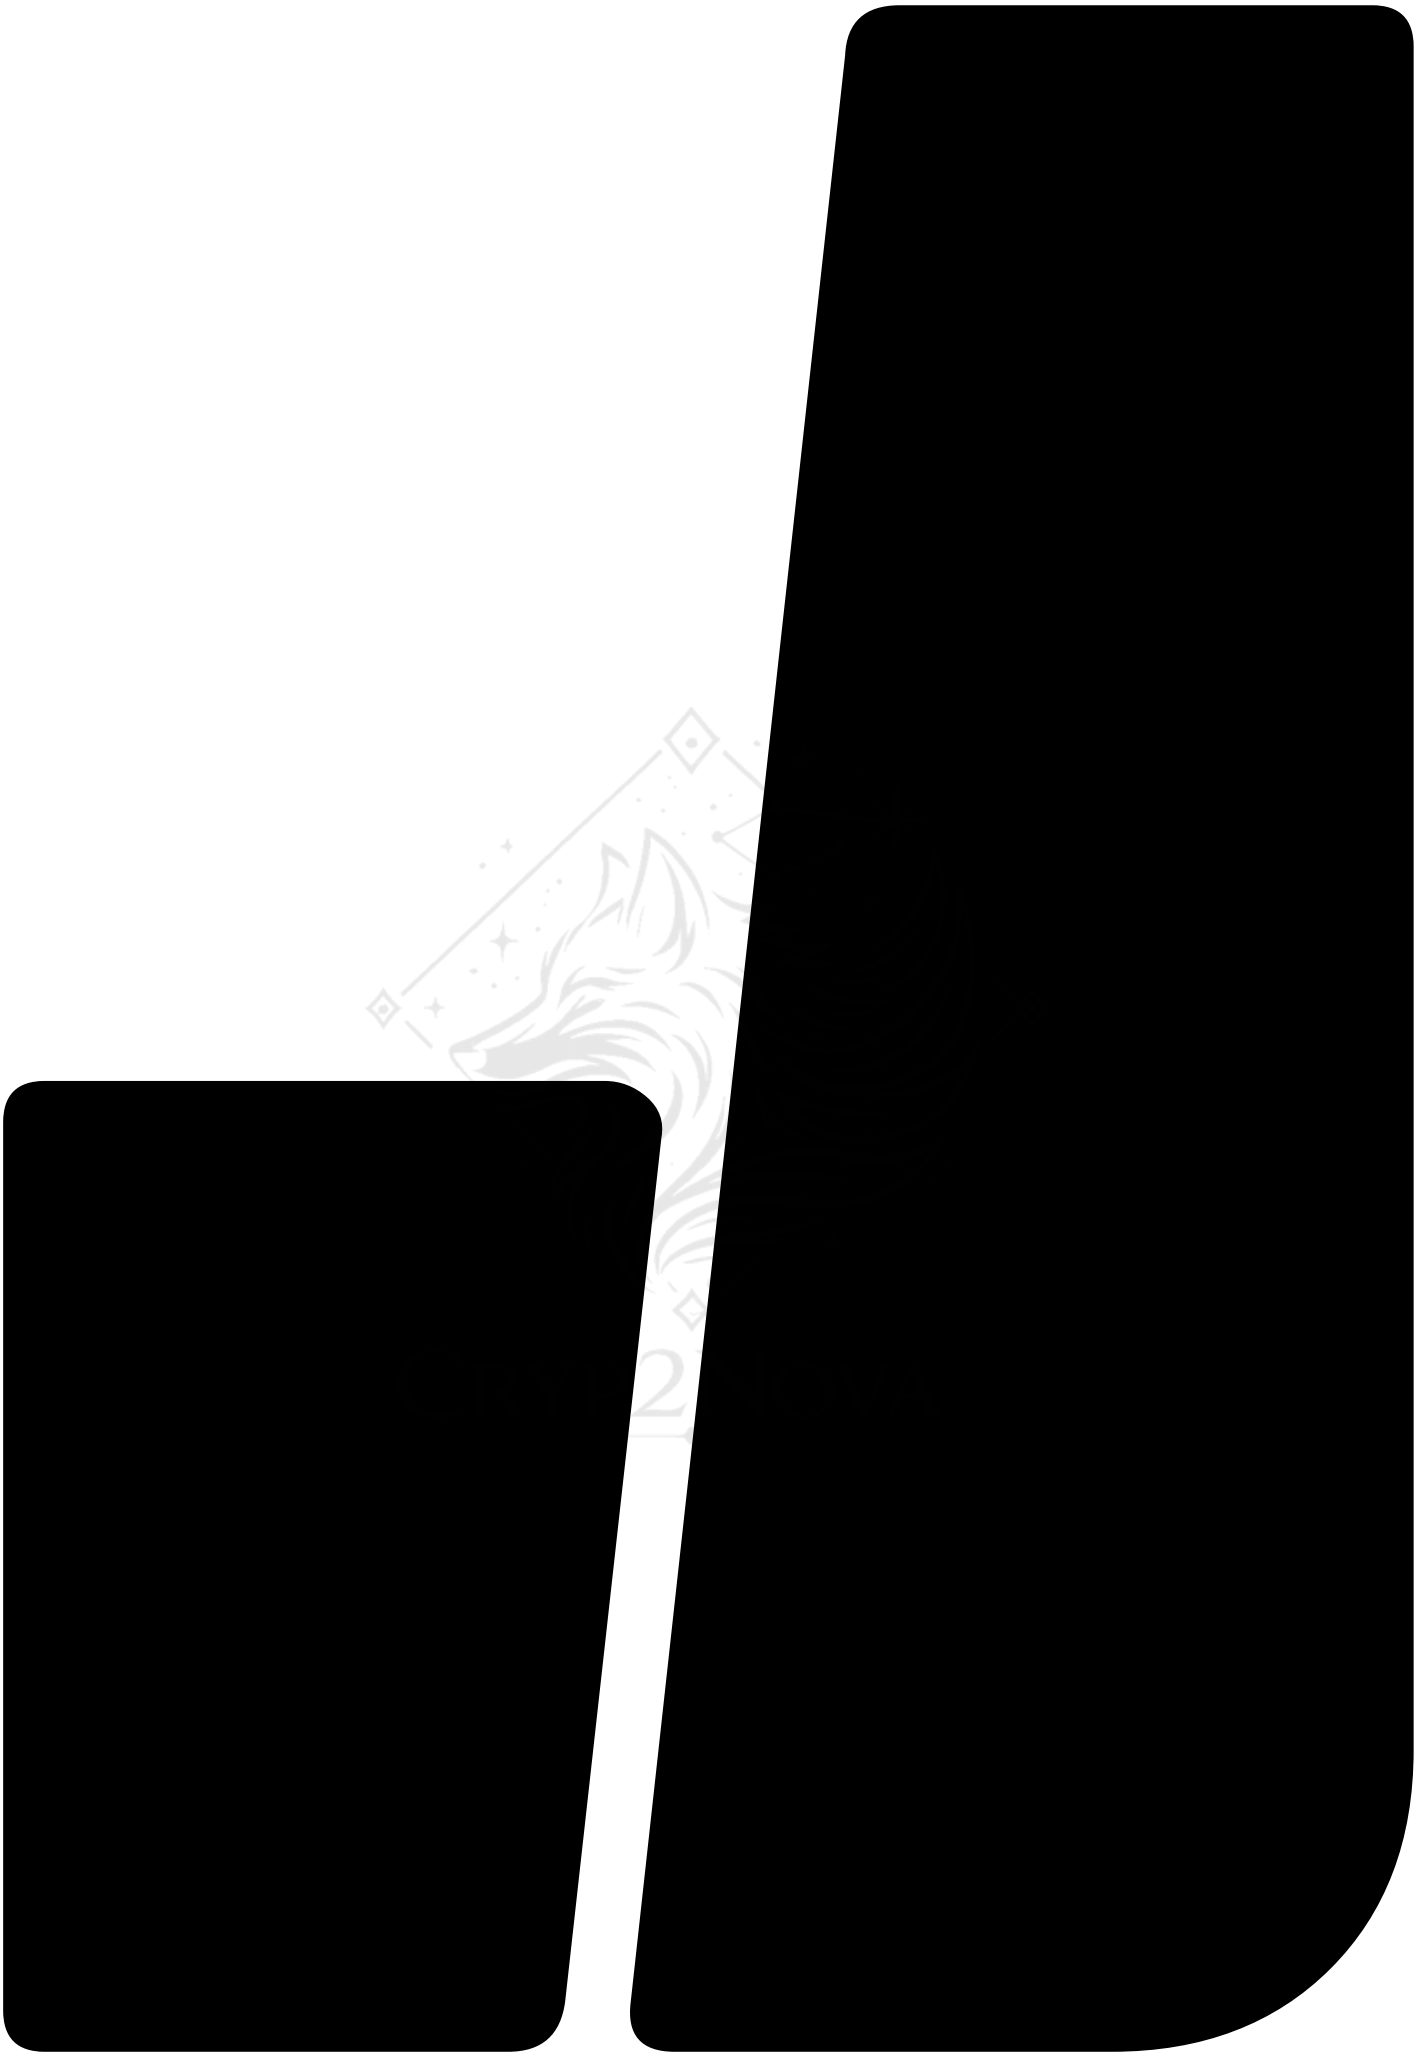

Can I see a token's holder distribution? +

Yes. Holder Snapshot pulls any token's holders, balances and concentration, and you can export the list. For links between wallets, the Wallet Scope map shows the transfer graph too.
