An Intelligent Yield Engine for Bitcoin Capital

Bedrock 2.0 marks a fundamental shift in what Bedrock is built to do. The original protocol focused on liquid restaking — routing BTC and ETH capital into staking and restaking protocols to earn rewards. That model established Bedrock's foundation. It also has a structural ceiling: restaking yields have been compressing across the category since mid-2024. This is not a single-protocol issue — it is a category reality. Bedrock 2.0 is our response.
