Introduction

Copy

USDtb is a digital dollar, otherwise known as a USD stablecoin. USDtb can be used the same way a holder would use any other dollar, whether to send and receive payments, acquire and trade assets, or to simply hold dollars.

Unlike actual dollars, USDtb is a blockchain-based token, which enables faster and cheaper spending than the traditional fiat banking system. Unlike many digital assets, USDtb is fully backed by institutional-grade tokenized U.S. treasury fund products (alongside a stablecoin reserve designed to facilitate rapid redemptions) to support stability. Initially, USDtb will be backed by BlackRock’s USD Institutional Digital Liquidity Fund Token, BUIDL.

As of October 13, 2025, the issuance, redemption, and reserve management for USDtb were transitioned to Anchorage Digital Bank.
