$VEXOR · coming soon

Planned SPL token on Solana. 100B supply.

The token contract has not been deployed yet. The Console and on-chain governance will open with the $VEXOR launch.

CRYP2NOVA

Vexor Terminal is a programmable AI orchestration platform. The orchestrator routes every request to one or more of nine specialized sub-agents: Cipher, Atlas, Quill, Forge, Vector, Pulse, Halo, Prism, and Nyx. Each sub-agent runs on its own LLM tier and is scoped to a single domain.

The protocol is governed by $VEXOR, an SPL token on Solana. Hold $VEXOR to access elevated tiers, stake to receive a pro-rata share of protocol revenue, and vote on protocol direction.

$VEXOR — soon

Status

Pre-launch

Archived copy · cryp2nova.com

The on-chain Console (stake / govern) is not yet live — it opens once the $VEXOR contract is deployed and verified on Solana. The flow below describes the launch-ready user path.

Step 1

Connect wallet on Solana

At launch, the Console will prompt a wallet connect and auto-switch the active network to Solana. Phantom, Solflare, and Backpack will be supported.

Step 2

Acquire $VEXOR

Once $VEXOR deploys on Solana, the verified program address will be posted on this site and on @vexorterminal. $VEXOR will be obtainable from the listed liquidity venues.

Step 3

Self-delegate for voting power

$VEXOR governance is token-weighted. Delegation activates voting power for governance proposals.

Step 4

Stake $VEXOR, earn revenue

The RevShare pool accepts $VEXOR deposits. Stakers receive a pro-rata share of protocol revenue — flat staking, withdraw any time.

Step 5

Use the orchestrator

The orchestrator chat is live during the pre-launch phase. Connect a wallet on the home page; each prompt is routed to the appropriate sub-agent.

Step 6

Subscribe to launch updates

Launch will be announced via @vexorterminal on X and the Watchtower Telegram bot.

The $VEXOR token and the revenue-share staking pool are not yet deployed on Solana. Once the programs ship, this section will list the verified mainnet addresses with direct links to Solscan.

⚠

Pre-launch

The $VEXOR contract address has not been published. Follow @vexorterminal for the launch announcement — the address will be posted there and added to this page once verified on Solscan.

The following describes the on-chain Console flow that will open at $VEXOR launch. None of these actions are live yet — the token contract has not been deployed.

Wallet tab

Displays the connected address, current chain, $VEXOR balance, and voting power. Two actions are exposed:

- Connect wallet — pick Phantom, Solflare, or Backpack on Solana.
- Self-delegate — one-time tx that activates voting power for governance.

Stake tab

Stakes $VEXOR under one of four lock tiers. Longer locks carry higher reward weight. The reward share for any position equals its weighted stake divided by total weighted stake.

Lock	Reward multiplier
30 days	1.0x
90 days	1.5x
180 days	2.0x
365 days	3.0x

Archived copy · cryp2nova.com

Pending rewards will stream in real time and can be claimed any time. Principal will unlock at the timestamp shown on each position.

Govern tab

Uses on-chain governance. Proposals require ≥100 $VEXOR voting power. Voters select For / Against / Abstain.

- Voting delay: 1 block
- Voting period: 7,200 blocks (~4 hours)
- Quorum: 4% of total supply
- Proposal threshold: 100 $VEXOR

Tier tab

Displays the current tier and progress to the next, derived from $VEXOR balance. See the full table below.

$VEXOR is an SPL governance token on Solana. Voting power requires delegation (one-time, minimal transaction fee).

Standard
SPL Token
Program
Anchor
Total supply
100,000,000,000
Decimals
18

Utility on the protocol (at launch):

- Pay for Runtime — burn $VEXOR per chat / task. Premium dispatch will cost more.
- Stake to Earn — receive a pro-rata share of the staking pool, scaled by lock multiplier.
- Governance — vote on new sub-agents, model whitelisting, treasury spend, upgrades.
- Token-Gated Tiers — Bronze / Silver / Gold / Black will unlock an elevated experience.

$VEXOR will be deployed on Solana with 100B total supply. The token has not launched yet — the verified contract address will be linked in the Contracts section once it ships. Distribution and launch venue will be announced before any liquidity is seeded.

Vexor exposes a single orchestrator interface. Routing is resolved across nine specialist sub-agents, each scoped to a single domain and bound to a specific LLM tier.

Tiers are computed from the connected wallet's $VEXOR balance at read time. They are not enforced on-chain (no NFT) — the protocol layer applies them as a soft access ladder.

Archived copy · cryp2nova.com

Tier	Minimum balance	Unlocks
—	0	Connect wallet to read on-chain state
Bronze	1,000 $VEXOR	Priority chat slot, 1-block latency
Silver	10,000 $VEXOR	Private channels + early sub-agents
Gold	100,000 $VEXOR	Beta sub-agents + private memory
Black	1,000,000 $VEXOR	Revenue dashboard + governance lead

Vexor Terminal consists of a static frontend, a thin LLM proxy, and a Solana program layer that deploys to Solana alongside the $VEXOR launch.

The frontend and chat backend are live during the pre-launch phase. The protocol layer (~600 lines of audited-pattern Anchor/Rust) deploys to Solana alongside the $VEXOR launch.
