Abstract:

PASS EVERYWHERE

The current ticketing system faces multiple issues, including server overload, decreased fairness due to bot usage, high resale prices, inconvenient user experience, lack of information, opaque policies, and regional restrictions. To address these problems, X-PASS introduces an NFT-based pass system that aims to prevent scalping in the ticketing process for various events and allows for quick entry without waiting in line.

The X-PASS platform connects various content stakeholders, providing efficient accessibility while addressing multiple issues related to ticketing. Issued NFT tickets promote the formation of fandom/fan communities and transparently manage new fan governance for various content. Additionally, the platform ensures the safe protection of customer information through a verification system that minimizes the use of personal data.

The $XPASS token functions as a utility token, serving as the currency used within the X-PASS ecosystem and services. The whitepaper provides an in-depth analysis of industry limitations, solutions, utilities, and services offered by X-PASS.
