Making AI Intelligent — the intelligence layer for AI

Verona ↗ is the intelligence layer for AI. It makes user-verified data portable, private, and programmable, so agents can transact on information the user actually owns.

Making AI Intelligent is the through-line. **Verify once · Reuse everywhere · Expose nothing.**

- **Truth Engine** makes intelligence grounded. Zero-knowledge verification across websites (zkTLS), email (zkEmail), passports (zkPassport), and apps (attestations) turns claims into provable, reusable facts—without revealing underlying secrets.
- **Generalized Abstraction** makes the network usable. Protocol-level abstractions for accounts, signatures, gas, payments, and devices remove friction for mainstream apps. Users log in with familiar credentials; developers ship Web2-quality UX on verifiable infrastructure.

CRYP2NOVA

About Verona

Learn what Verona is, how verification and abstraction fit together, and the product surfaces you can build on.

What is Verona?

Overview of the intelligence layer, Truth Engine, and abstraction stack.

Truth Engine

zkTLS, zkEmail, zkPassport, and app attestations—verify once, reuse everywhere.

Surfaces

Ero (EarnOS) and Burnt Verified—live consumer and enterprise proof.

Build on Verona

Guides for developers building apps, agents, and integrations on the network.

CRYP2NOVA

Accounts

Meta Accounts, authentication, gasless transactions, and web, backend, or mobile app development.

Computation

Quick-start apps, local development, contract library, and integrations (tokens, oracles, indexers).

Verification

Verify real-world data and identity without revealing it—zkTLS, ZK email, and app attestations.

Tools & SDKs

Verona Agent Toolkit, daemon CLI, Mob signing client, and Abstraxion.

For AI Agents

One-line setup for agentic development with Meta Accounts and Treasury.

Help & Support

Discord Developer Support

Chat with developers on Discord.

Telegram Developer Support

Chat with developers on Telegram.

Why Verona

AI agents need verified information they can act on without becoming custodians of sensitive data. Verona makes verified facts portable, private, and reusable across authorized applications and agents.

Verify once, let the user control reuse, and expose proofs instead of raw records.
